1.2. Antenna Description

| Antenna | Frequency | T _X | Directional Gain (dBi) | | |
|---------|-----------|----------------|------------------------|--------------------|--|
| Type | Band | Paths | Non Beam Forming | CDD & Beam-Forming | |
| | (GHz) | | Mode | Mode | |
| DOD | 2.4 | 2 | 1.40 | | |
| PCB | 5.2 | 4 | | 8.90 | |
| Antenna | 5.8 | 4 | | 9.00 | |

Note:

- 1. Transmit at 2.4GHz support two antennas, and support four antennas at 5GHz transmit.
- 2. The EUT working on Beam Forming mode at 802.11n/ac, and working on CDD mode at 802.11a.
- 3. Correlated signals include, but are not limited to, signals transmitted in any of the following modes:
 - Any transmit Beam Forming mode, whether fixed or adaptive (e.g., phased array modes, closed loop MIMO modes, Transmitter Adaptive Antenna modes, Maximum Ratio Transmission (MRT) modes, and Statistical Eigen Beam Forming (EBF) modes).
- 4. Unequal antenna gains, with equal transmit powers. For antenna gains given by $G_1, G_2, ..., G_N$ dBi
 - transmit signals are correlated, then
 - Directional gain = 10 log[(10^{G1/20} + 10^{G2/20} + ... + 10^{GN/20})²/N_{ANT}] dBi [Note the "20"s in the denominator of each exponent and the square of the sum of terms; the object is to combine the signal levels coherently.]

2. RF Exposure Evaluation

2.1. Limits

According to FCC 1.1310: The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in 1.1307(b)

LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

| Frequency Range | Electric Field | Magnetic Field | Power Density | Average Time | | | |
|-----------------------------------------------------------|------------------------------------------------|----------------|-----------------------|--------------|--|--|--|
| (MHz) | Strength (V/m) | Strength (A/m) | (mW/cm ²) | (Minutes) | | | |
| | (A) Limits for Occupational/ Control Exposures | | | | | | |
| 300-1500 | | | f/300 | 6 | | | |
| 1500-100,000 | | | 5 | 6 | | | |
| (B) Limits for General Population/ Uncontrolled Exposures | | | | | | | |
| 300-1500 | | | f/1500 | 6 | | | |
| 1500-100,000 | | | 1 | 30 | | | |

f= Frequency in MHz

Calculation Formula: Pd = (Pout*G)/(4*pi*r2)

Where

Pd = power density in mW/cm2

Pout = output power to antenna in mW

G = gain of antenna in linear scale

Pi = 3.1416

r = distance between observation point and center of the radiator in cm

Pd is the limit of MPE, 1mW/cm². If we know the maximum gain of the antenna and the total power input to the antenna, through the calculation, we will know the distance r where the MPE limit is reached.
